TITLE: Calculations of rotating toroidal casings

PERIODICAL: Akademiya nauk SSSR. Izvestiya. Otdeleniye
tekhnicheskikh nauk. Mekhanika i mashinostroyeniye.
no.5, 1961, 90-95

TEXT: Rotating casings of toroidal shape are used in several types of machines; the casings are filled with a fluid and, when operating, the inherent centrifugal forces of the casings are supplemented by those of the fluid. The paper deals with the forces acting on such a rotating casing, and supplements the work of previous authors; it also deals with comparatively simple formulas for establishing the maximum forces to which toroidal shaped casings may be subjected. In the example quoted in the text, a casing is subjected to a normal pressure, which varies with the radius, according to parabolic law. The differential equation covering the various stresses in the casing is established and is solved by a complex variable method. The effect on the solution of varying boundary conditions of the casing is also investigated. By using the solution, sundry formulae, dealing with meridional

bending moments and axial and circumferential stresses, are presented. Two examples are included showing application of the solution and formulae are found for the maximum stresses to which the casing may be subjected. There are 1 figure and 10 references; 7 Soviet-bloc and 3 non-Soviet-bloc. The reference to an English language publication reads as follows: Ref. 9: Tables of the Modified Hankel Functions of Order one-third and their Derivatives. The Annals of the Computation Laboratory of Harvard University, 1945, v.2.

TITLE: Hypersensitization of nuclear photoemulsions

PERIODICAL: Referativnyy zhurnal. Fizika, no 5, 1961, 69-70, abstract 5B176 ("Tr. Vses. n.-i. kinofotoin-ta", 1959, no 32, 5 - 18)

TEXT: A number of theoretical and practical problems connected with the employment of triethanolamine for hypersensitization of nuclear emulsions are investigated. Optimum conditions are selected for dipping of plates of the P (R) type in triethanolamine; it is shown that some growth of fog can be easily eliminated by the subsequent underdevelopment. The high sensitivity attained drops noticeably in the storing process, and this restricts the employment of emulsions dipped in triethanolamine for lasting experiments, e.g. for studying cosmic rays. The treatment with triethanolamine after exposure yields no results. Other alkali solutions affect the sensitivity considerably less than triethanolamine at the same pH 9 as the latter. Introduction of triethanolamine prior to coating fogs conventional R-type emulsions; however, using undermatured emulsions one

can attain rather high sensitivity by introducing triethanolamine prior to coating, but in this case the quantity of triethanolamine needed is much greater than for dipping. The washing out of triethanolamine from the emulsion prior to exposure reduces sensitivity almost to the initial level. The employment of mono- and diethanolamines is less efficient than that of triethanolamine. To explain the effect of triethanolamine, the authors hold that it is necessary to ascribe to it, in addition to its inherent reducing and alkaline properties, the ability of transferring radiation energy, absorbed in gelatine, to emulsion crystals. To prove the existence of this ability, special experiments were carried out in which emulsions were exposed to ultraviolet rays through a gelatine film absorbing them completely.

TITLE: Raising sensitivity of nuclear photoemulsions at low temperatures as a result of hypersensitization

PERIODICAL: Referativnyy zhurnal. Fizika, no 5, 1961, 70, abstract 5B178 ("Tr. Vses. n.-i. kinofotoin-ta", 1959, no 32, 26 - 28) X

TEXT: Degree of sensitivity to minimum ionization particles preserved at temperatures -186 and -252°C was investigated in the following types of R emulsions: conventional (I), hypersensitized by triethanolamine (II), special iodine-free emulsion prior to hypersensitization (III) and the same after hypersensitization (IV). The degree of sensitivity preservation at -186°C proved to be ~70% in (I), ~50% in (II), ~70% in (III); the density of tracks was ~20-25 in (I) and (III) and 40-50 grains/100 μ in (II). At -252°C sensitivity is completely absent in (I); in (II) it preserved by ~40%, in (III) by ~70%, and in (IV) by

TEXT: A method of hypersensitizing various types of nuclear emulsion layers by means of triethanolamine (TEA) solutions is described. When studying the sensitizing effect of TEA it was found that TEA mainly influences the formation of the latent image, while its influence on the development process is unimportant. The effect of TEA is assumed to be connected with the gelatin structure of the emulsion layer which is definitely formed after the layer has dried. Results were obtained which prove that if TEA is present in the layer that energy can be partially utilized in the photographic process which has been absorbed by the gelatin layer. TITLE: The Sensitivity of Hypersensitized Nuclear Photographic Emulsions at the Temperature of Liquid Hydrogen (Chuvstvitel'nost' gipersensibilizirovannykh yadernykh fotografičeskikh emul'siy pri temperaturе zhidkogo vodoroda)

PERIODICAL: Zhurnal nauchnoy i prikladnoy fotografii i kinematografii, 1958, Vol 3, Nr 5, pp 380-381 (USSR)

ABSTRACT: Backingless "P" films with iodide, and others without iodide, sensitized in a 3% solution of triethanolamine, were exposed in liquid hydrogen to gamma-radiation at 250 mev or to a beam of Pi-mesons at 300 mev. The results are drawn up in tabular form. The trajectories of the relativistic particles, at the temperature of liquid hydrogen, can be traced in the form of very dense tracks on the hypersensitized, iodine-less "P" silver bromide nuclear emulsions. A significant drop in the sensitivity of the emulsions containing iodide at liquid hydrogen temperature can be confirmed from the table. There is 1 table and 2 Soviet references.

PHASE I BOOK EXPLOITATION

SOV/2045

Ruditsyn, M. N., P. Ya. Artemov, and M. I. Lyuboshits

Spravochnoye posobiye po soprotivleniyu materialov (Handbook on the Strength of Materials) Minsk, Gos. Izd-vo BSSR, 1958. 508 p. Errata slip inserted. 20,000 copies printed.

Ed. (Title page): M. N. Ruditsyn; Ed. (Inside book): I. Chernyak; Tech. Ed.: N. Stepanova.

PURPOSE: The handbook is intended for design and manufacturing departments of machine-building plants and for students of technical schools.

COVERAGE: The book presents basic principles, working formulas, charts, and tables. It includes information on deformations and stresses in tension, compression, bending, torsion, and shearing, as well as on designs of beams, thick-walled cylinders, and thin-walled columns with open cross sections. The stability of elastic systems, the design of statically indeterminate systems, and elasto-plastic bending and torsion are discussed. Cyclical stresses and dynamic loading are explained. Data on the mechanical

Sponsoring Agency: Belorusskiy politekhnicheskiy institut. Kafedra "Soprotivleniye
materialov."

Ed. (Title page): M.N. Ruditsyn; Ed.: G.A. Kuz'michenko; Tech. Ed.: Ye.I.Yarish.

PURPOSE: This textbook is intended for students in advanced courses on the
strength of materials.

COVERAGE: This book presents in concise form the theory of stresses in thin-
walled bars with open cross sections as well as the procedures used in
stress and stability analysis. Included are cases of constrained torsion,
bending torsion, and the eccentric application of longitudinal forces. A

Raschetno-graficheskiye raboty po soprotivleniyu materialov (Computation and Graphic Work on Strength of Materials) Minsk, Izd-vo Belorusskogo gos. univ-ta, 1957. 227 p. 9,000 copies printed.

Sponsoring Agencies: Belorusskiy politekhnicheskiy institut, and Ministerstvo vysshego obrazovaniya SSSR.

Ed.: Kitsenko, L.; Tech. Ed.: Belen'kaya, I.

PURPOSE: This book is a handbook for students intended to help them solve practical problems on the strength of materials. It will also save the time of teachers in preparing problems for their classes.

COVERAGE: This textbook is based on problems on the strength of materials compiled by the Belorusskiy politekhnicheskiy institut, imeni Stalina (Belorussian Polytechnical Institute imeni Stalin). It consists of about 300 solutions to problems on the strength of rods, bars, frames, etc., under various combined

Card 1/4

Computation and Graphic Work on Strength of Materials

784

loading conditions. Theoretical considerations and basic formulas for the completion of the analytical and graphical work, methodical instructions on the order and technique of solving the problems are given. Each problem is followed by practical instructions for the generalization of basic design requirements and by a method of checking the completed computations. In special cases, when it was considered necessary, examples of computations are given. Chapter XII contains: computation formulas and tables, mechanical characteristics of materials, values of some coefficients, tables of rolled-steel sizes, etc. The following personalities assisted in the compilation of this book: Ye.S. Bogdanov, Docent; Senior Instructors I.F. Kurovskiy, V.P. Laptev, A.G. Petrovich; L.I. Osherovich, Candidate of Technical Science; B.V. Rul', Assistant; M.I. Lyuboshits, Docent; P.Ya. Artenov, Docent. The author thanks Professors S.S. Kryukovskiy and A.A. Kravtsov, and S.V. Rabinovich, Docent for reviewing the manuscript. There are no references.

AUTHOR: Rudiuk, Andrzej (Master of engineering)

TITLE: Sound absorbing and insulating systems in aviation

SOURCE: Technika lotnicza, no. 4, 1964, 103-106

TOPIC TAGS: acoustics, sound absorption, insulation, heat insulation, vibration isolation, insulating material

ABSTRACT: This work reviews the problems of sound insulation in aircraft, and briefly describes the systems in the Il-2, Il-4, Il-18 and Convair-240 airplanes. In order to provide insulation in an aircraft with four 330-horsepower engines, investigations were conducted of insulations consisting of granules of polystyrene foam with and without epoxy resins, formed into perforated boards with a coating of thin paper or aluminum foil. An insulating board meeting the insulation requirements and other physical conditions and weighing 0.4 kg/m^2 was obtained.

Abs Jour: Ref Zhur-Khimiya, No 5, 1957, 14392

Abstract: absorption limits from the region of long waves and the absorption maxima of trans-isomers lie in the region of lower frequencies than for cis-isomers which is explained by a greater bond strength in trans-complexes. The conversion of this order in solution is explained by the trans-influence effect in solutions, which loosens the bond between the central atom and the substitute.

TITLE: Apparatus for measuring the temperature of revolving machine details.
Class 42, No. 180833 [announced by Institute of Technical Thermophysics, AN UkrSSR
(Institut tekhnicheskoy teplofiziki AN UkrSSR)]

SOURCE: Izobreteniya, promyshlennyye obraztsy, tovarnyye znaki, no. 8, 1966, 91

TOPIC TAGS: temperature measurement, thermocouple, electromagnet, magnetic circuit,
MEASURING INSTRUMENT, MECHANICAL STRESS

ABSTRACT: This Author Certificate presents an apparatus for measuring the temperature of revolving machine details. The apparatus contains thermocouples fixed on the revolving detail and connected into the chain of movable electromagnets of the induction-type contactless current receivers. The fixed magnets of the latter are connected into a circuit for amplifying and registration of the measured impulses (see Fig. 1). To diminish the influence of the machine shaft displacement and the interference of the nearby electromagnets, the magnetic connections of the fixed magnets are provided with magnetic screens placed on both sides of the connections in parallel to the rotation axis. The shaft carries a spline-like

TITLE: Investigating radial components of velocity pulsation
during the motion of air in short pipes

PERIODICAL: Akademiya nauk Ukrayins'koyi RSR. Dopovidi, no. 5,
1961, 644 - 648

TEXT: The ratio of these pulsations to mean velocity is usually
considered as degree of turbulence (the so-called Karman number)
where $\sqrt{w_r'^2}$ is the mean square value of the radial component of
velocity pulsation, w_0 the mean velocity of streaming, with res-

pect to the cross section of the pipe. The experiments were made on
a seamless, hydraulically smooth pipe with inner diameter of 51 and
length of 4000 mm. To increase initial disturbances, special tur-
bulizers were put before the pipe, in the form of perforated pla-

tes and gratings having different diameters of openings and different coefficients β (ratio of free passage to total area). Measurements of magnitude of the pulsations were made according to the thermoanemometric method with the aid of ETA-5A set of instruments. The sensitive element was a V-shaped pickup connected with two adjacent arms of the measuring bridge. Pulsations were measured at seven longitudinal sections of the pipe and at seven points within each section. The type of variation shown here was found to be valid for all turbulizers, without any exception, also for a stream of air in a pipe without artificial disturbances. It can be assumed that the part of the pipe where the radial component of velocity pulsation is variable, is the zone of hydrodynamical stabilization of the stream. The relative length of this zone depends on geometrical characteristics of the turbulizer. Practically only one turbulizer among those tested had corresponding zone of stabilization longer than 30 diameters. Two other turbulizers were intended for calming and are not considered. The value of Kr can be found, with possible error up to 10 %, from

$$K_{r_{ser}} = \frac{210}{Re^{0.5}} \quad (2)$$

($K_{r_{ser}}$ is the mean value of K_r with respect to cross section of the pipe). The absolute value of the radial component of pulsation is

$$\sqrt{\overline{w_r^2}} = 6,45 \cdot 10^{-4} Re^{0.5}. \quad (3)$$

The attempt to find an empirical formula for the radial component of pulsation with respect to the length of stabilization zone has failed. The authors find that the determination of the radial component of pulsation alone is insufficient for the characterization of the stream in the initial zone of the pipe. There are 3 figures.

TITLE: Optical properties of admixture centers and the photoconductivity of cuprous oxide

PERIODICAL: Ukrayins'kyy fizychnyy zhurnal, v. 8, no. 1, 1963,
96-100

TEXT: The authors measured absorption spectra of admixtures, energy distribution in the photoluminescence spectrum and special dependences of photoconduction kinetics in Cu₂O specimens annealed under various conditions. Results are given for three typical specimens annealed in oxygen at 1) 1.0 mm Hg, 1070°C, 2) 0.002 mm Hg, 700°C, 3) 0.0010 mm Hg, 800°C. Specimen no. 1 exhibits photoconductivity at the long-wave end of the band, no. 3 has maximum photoconductivity at 7200 Å, and no. 2 has intermediate properties. The results are discussed in detail. The intensity of admixture absorption is correlated with that of short-wave photoluminescence bands, which are probably associated with oxygen

vacancies. The latter cause an admixture photoconductivity in the long-wave part of the spectrum, characterized by long relaxation times. The interaction of excitons with different admixture centers is found to be selective. There are 3 figures.
